 TI DIALDEHYDES AS IMMUNOSTIMULATORY ADJUVANTS AND CROSS-LINKERS FOR

PRODUCING IMMUNOGENIC PREPARATIONS AND GENERATING PRESSURE AND CROSS-LINKED TREATED CELLS FOR ENHANCING AND AUGMENTING THE IMMUNE RESPONSE AGAINST CANCERS, TUMORS AND PATHOGENIC DISEASES

DIALDEHYDES SERVANT D'ADJUVANTS IMMUNOSTIMULANTS ET DE RETICULANTS POUR LA PRODUCTION DE PREPARATIONS IMMUNOGENES. POUR LA GENERATION DE CELLULES SOUMISES A PRESSION ET RETICULATION AFIN DE RENFORCER ET D'AUGMENTER LA REPOSE IMMUNITAIRE CONTRE LE CANCER, LES TUMEURS ET LES AFFECTIONS PATHOGENES

DETD

the host cell may be a neoplastic cell (including a primary tumor cell or a cell of a tumor cell line), a bone marrow hematopoietic cell, a peripheral blood cell or a TIL.

The present results established the ability to transfect unmodified stem cells, unmodified primary lymphoid cells such as T cells, a variety of freshly isolated tumor cells and cultured mammalian cell types, with high efficiency leading to both transient and sustained expression of the transfected DNA. The ability to efficiently transfect unmodified T cells, such as tumor infiltrating lymphocytes, unmodified stem cells, tumor cell line cells and primary tumor cells is disclosed for the.

the prostate cell line. Ten Mg PATK-Jgal or PADA-Jgal plasmid DNA was complexed with 10 mmoles liposomes and the complexes used to transfect 106 cells in 2 ml volume. At various time points, approximately 5 x 105 cells were harvested and stained with fluorescent substrate.

serve as a tumor vaccine. Furthermore, DNA encoding any of the foregoing proteins or peptides is delivered into peripheral blood cells or bone marrow cells to treat hematologic or neoplastic diseases or conditions.

cell-depleted cell fraction was enriched in neoplastic cells.

All autologous neoplastic cells were characterized by light microscopy, flow cytometry and immunohistochemical staining to assess oncogene expression and to establish a proliferation index. For example, for studies of breast cancer, only cells with the morphology of breast cancer.

of these controls were subtracted from the values of transfected groups.

9. Transgene Expression in Primary Tumor Cells  
AAV plasmid-liposome complexes were employed to transfect various primary tumor cells. one lung, one ovarian, and two breast tumor samples were isolated from fresh tumor biopsies. Tumor cells were.

relied primarily upon transgene insertion into retrovirus or DNA virus vectors. A fundamental disadvantage of the retrovirus system is the inability to transfect non-dividing primary cells. The present invention shows that cationic liposomes comprising AAV material mediates transfection of dividing and non-dividing cell types.

As shown herein, cationic liposomes facilitated AAV plasmid transfections into cells. The ability to transfect primary tumor cells has great importance because such cells have generally been very difficult to transfect. In addition to the high level of gene expression effected by the present method, the use of AAV plasmid:liposomes induced long term (>30.

Transfected tumor cells are used as potent immunogens in

tumor vaccination protocols. For treatment, the transfected neoplastic cells are typically provided together with a pharmaceutical excipient, as is known in the art, transfected neoplastic cells are also used to stimulate corresponding.

for peripheral blood mononuclear cells  
DCs are also generated in vitro by culturing human CD34+ progenitor or stem cells from peripheral blood, bone marrow

or cord blood in the presence of GM-CSF and tumor necrosis factor- $\gamma$ , with the optional presence of IL-3 (Caux, C, et al., Nature.

such as EBV-associated peptides. For example, DC cells are pulsed with HLA-A2- or HLA-B8-restricted EBV peptides or with peptides derived from the oncogene HER2, carcinoembryonic antigens (CEA) (see below), MUC1 supra, K-ras and the like. Alternatively, DNA constructs containing the genes encoding these tumor-associated peptides.
